SUPERSCRIPT™ II
RNase H- Reverse Transcriptase

Cat. No. 18064-014
Lot No. Y00146
Exp. Date. Store at -20°C (not frost-free).

SUPERSCRIPT II RNase H- Reverse Transcriptase (U.S. Patent 5,244,797) is purified to near homogeneity from E. coli containing the pol gene of Moloney Murine Leukemia Virus (1,2). The enzyme is used to synthesize first strand cDNA and will generally give higher yields of cDNA and more full length product than other reverse transcriptases.

Unit Definition:
One unit incorporates 1 nmole of dTTP into acid-precipitable material in 10 min at 37°C using poly(A)•oligo(dT)$_{25}$ as template-primer (3).

Storage Buffer:
20 mM Tris-HCl (pH 7.5)
100 mM NaCl
0.1 mM EDTA
1 mM DTT
0.01% (v/v) NP-40
50% (v/v) glycerol

Additional Components Provided:
The 5X First Strand Buffer [250 mM Tris-HCl (pH 8.3 at room temperature), 375 mM KCl, 15 mM MgCl$_2$] and 0.1 M DTT are provided. Store both solutions at -20°C. Thaw the solutions at room temperature just prior to use and refreeze immediately.

Doc. Rev.: 101397

This product is distributed for laboratory research use only. CAUTION: Not for diagnostic use. The safety and efficacy of this product in diagnostic or other clinical uses has not been established.

For technical questions about this product, call the Life Technologies TECH-LINE™ (800) 626-3511.
Quality Control Assays:
This product has passed the following quality control assays:
SDS-polyacrylamide gel analysis for purity; functional absence of
deoxyribonuclease, 3' and 5' exodeoxyribonuclease, and ribonuclease activities;
yield and length of cDNA product.

Note: Limited Label License
This product is the subject of claims in US Patent 5,405,776 and 5,244,797,
owned by Life Technologies, Inc. Purchase of this product conveys to the buyer
only the non-transferable right under these patents to use the product in research
conducted by the buyer. The buyer cannot sell or otherwise transfer this product
to a third party. Life Technologies, Inc. reserves all other rights, and this product
may not be used in any manner other than provided herein. In particular,
without prior written agreement between the buyer and Life Technologies, Inc.,
no rights under these above patents are conveyed to the buyer to use the product
in manufacturing, or to resell the product or components of the product as a
standalone reagent or in a kit, whether or not such standalone reagent is resold or
such kit is resold for use in research. If the purchaser is not willing to accept the
limitations of this Label License, Life Technologies, Inc. is willing to accept
return of the product with a full refund. For information on purchasing a license
to this product for purposes other than research, contact the Director of Corporate
Development, 9800 Medical Center Drive, Rockville, MD 20849. Phone (301)
610-8000. Fax (301) 610-8383.
**First Strand cDNA Synthesis Using SUPERSCRIPT II for RT-PCR:**

A 20-μl reaction volume can be used for 1-5 μg of total RNA or 50-500 ng of mRNA. Add the following components to a nuclease-free microcentrifuge tube:

1. 1 μl Oligo (dT)12-18 (500 μg/ml)
2. 1-5 μg total RNA
3. Sterile, distilled water to 12 μl

Heat mixture to 70°C for 10 min and quick chill on ice. Collect the contents of the tube by brief centrifugation and add:

1. 4 μl 5X First Strand Buffer
2. 2 μl 0.1 M DTT
3. 1 μl 10 mM dNTP Mix (10 mM each dATP, dGTP, dCTP and dTTP at neutral pH)

Mix contents of the tube gently and incubate at 42°C for 2 min. Add 1 μl (200 units) of SUPERSCRIPT II, mix by pipetting gently up and down. Incubate 50 min at 42°C. Inactivate the reaction by heating at 70°C for 15 min. The cDNA can now be used as a template for amplification in PCR. However, amplification of some PCR targets (those >1 kb) may require the removal of RNA complementary to the cDNA. To remove RNA complementary to the cDNA, add 1 μl (2 units) of E. coli RNase H and incubate 37°C for 20 min.

Alternatively 50-250 ng of random primers or 2 pmole of a gene specific primer may be used. Use of random primers requires incubation at 25°C for 10 min before the 42°C incubation.
**PCR Reaction**

Use only 10% of the first strand reaction for PCR. Adding larger amounts of the first strand reaction may not increase amplification and may result in decreased amounts of PCR product.

1. Add the following to a PCR reaction tube for a final reaction volume of 100 µl:

<table>
<thead>
<tr>
<th>Volume</th>
<th>Component</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 µl</td>
<td>10X PCR Buffer</td>
<td>200 mM Tris-HCl (pH 8.4), 500 mM KCl</td>
</tr>
<tr>
<td>3 µl</td>
<td>50 mM MgCl₂</td>
<td></td>
</tr>
<tr>
<td>2 µl</td>
<td>10 mM dNTP Mix</td>

</tr>
<tr>
<td>80 µl</td>
<td>cDNA (from first strand reaction)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>autoclaved, distilled water</td>
<td></td>
</tr>
</tbody>
</table>

2. Mix gently and layer 2 drops (~100 µl) of silicone oil over the reaction. (Note: the addition of silicone oil is unnecessary in thermal cyclers equipped with a heated lid.)

3. Heat reaction to 94°C for 3 min to denature.

4. Perform 15 to 40 cycles of PCR. Annealing and extension conditions are primer and template dependent and must be determined empirically.

Optimal concentration of MgCl₂ needs to be determined empirically for each template primer pair.
